

# Faroese Pilot Whale Hunt

Scientific research,

On-going biological sampling of pilot whales in the Faroe Islands, together with regular sightings surveys and satellite tracking projects are important tools that provide updated information for management to ensure that the pilot whale catch in the Faroes continues to be sustainable.

**These words scientific research and sustainable just keep cropping up don't they. Please write to the addresses below and let them know what you think.**

I recently watched an RT. Documentary where one of these hunters/supporters cooked the tail end of some sort of crayfish and then ate it while the front end was still alive. This kind of depravity not only doesn't belong in any society of today but doesn't even belong in any history book. It just reveals the appalling disregard for life these butchers have.
